myproject/

← This is your git repository, and should usually match the name on Github

myproject/ README.md

the package. You write this in plain ← Markdown-formatted file describing text and GitHub renders it

Markdown Resources:

- http://www.markdowntutorial.com/
- https://guides.github.com/pdfs/markdown-cheatsheet-online.pdf

myproject/ README.md LICENSE

The license lets you specify how others may use your code.

Licensing Resources:

http://www.astrobetter.com/blog/2014/03/10/the-whys-andhows-of-licensing-scientific-code/

```
myproject/
README.md
LICENSE
myproject/
```

← The python package. When you do "import myproject", this is what gets imported.

```
myproject/
README.md
LICENSE
myproject/
init_.py
```

← This file marks the directory as a Python package.

```
myproject/
README.md
LICENSE
myproject/
init_.py
```

— other files in the package contain importable code.

```
myproject/
README.md
LICENSE
myproject/
init_.py
core.py
submodule/
submodule/
script.py
```

— modules can have submodules (and sub-submodules, etc.) to any depth.

```
myproject/
README.md
LICENSE
myproject/
init_.py
core.py
+submodule/
```

```
myproject/
README.md
LICENSE
myproject/
init_.py
core.py
+submodule/
tests/
tests/
tests/
test.ore.py
```

```
init ...py

version = "1.0"

from .core import add
```

```
core.py
```

```
test_core.py
```

```
def test_add(a, b):
    assert add(1, 1) == 2
    assert add(0, 1) == 1
    assert add(-1, 1) == 0
```

You can use, for example, pytest¹ to run these tests:

```
# in the top-level directory,
# run this shell command:
$ pytest mymodule
```

1 http://doc.pytest.org/

```
myproject/
README.md
LICENSE
myproject/
init_.py
core.py
+submodule/
+tests/
```

```
myproject/
README.md
LICENSE
+myproject/
```

```
myproject/
README.md
LICENSE
+myproject/
setup.py
```

the setup.py script allows the package to be installed

setup.py resources:

- https://github.com/pypa/sampleproject/
- https://github.com/uwescience/shablona

```
myproject/
README.md
LICENSE
+myproject/
setup.py
+doc/
```

← the documentation directory lives beside your project. One good option is sphinx¹

1 http://www.sphinx-doc.org/

```
myproject/
README.md
LICENSE
+myproject/
setup.py
+doc/
examples/
examples/
Demo.ipynb
```

if you have example code or notebooks, use an examples directory.

```
myproject/
README.md
LICENSE
+myproject/
setup.py
+doc/
+examples/
```

```
myproject/
README.md
LICENSE
+myproject/
setup.py
+doc/
+examples/
+paper/
```

← if I'm developing the code for research, I usually put the paper LaTeX here (along with scripts for figures, etc.)

```
myproject/
README.md
LICENSE
+myproject/
setup.py
+doc/
+examples/
+paper/
gitignore
```

.gitignore example:

```
# Python bytecode
*.pyc

# notebook temporary files
.ipynb_checkpoints

# emacs temporary files

*~
```

this file helps keep your directory clean, by telling git types of files to not track.
